# Experiment No: 4

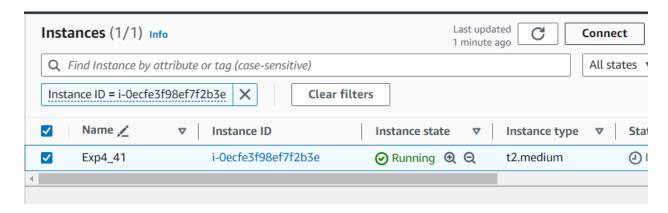

<u>AIM:</u> To install Kubectl and execute Kubectl commands to manage the Kubernetes cluster and deploy Your First Kubernetes Application.

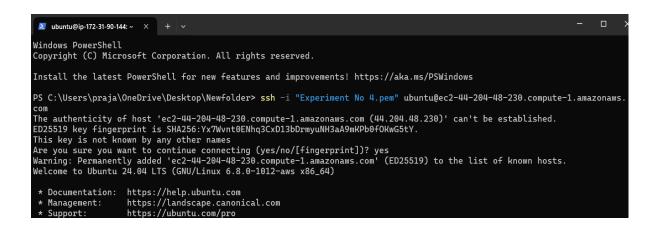

### **STEPS**:

**Step 1:** Access your AWS Academy or personal account and initiate the launch of a new EC2 instance. Select **Ubuntu as the Amazon Machine Image (AMI)** and choose **t2.medium** for the instance type. Generate an RSA key with a .pem file extension, and relocate the downloaded key to the designated folder. **Note:** Since at least 2 CPUs are needed, ensure you select t2.medium

**Step 2:** Once the instance is created, click on the option to connect to the instance and go to the SSH client section. Now open the folder in the terminal where our .pem key is stored and paste the Example command (starting with ssh -i .....) in the terminal.

Step 3: Execute the following commands to install and set up Docker.

a) curl -fsSL https://download.docker.com/linux/ubuntu/gpg | sudo apt-key add - curl -fsSL https://download.docker.com/linux/ubuntu/gpg | sudo tee /etc/apt/trusted.gpg.d/docker.gpg > /dev/null sudo add-apt-repository "deb [arch=amd64] https://download.docker.com/linux/ubuntu \$(lsb release -cs) stable"

```
ubuntu@ip-172-31-90-144:~$ curl -fsSL https://download.docker.com/linux/ubuntu/gpg | sudo apt-key add -
curl -fsSL https://download.docker.com/linux/ubuntu/gpg | sudo tee
/etc/apt/trusted.gpg.d/docker.gpg > /dev/null
sudo add-apt-repository "deb [arch=amd64] https://download.docker.com/linux/ubuntu
$(lsb_release -cs) stable"
```

```

[kubelet-start] Writing kubelet environment file with flags to file "/var/lib/kubele
[kubelet-start] Writing kubelet configuration to file "/var/lib/kubelet/config.yaml"
[kubelet-start] Starting the kubelet
```

```
Your Kubernetes control-plane has initialized successfully!

To start using your cluster, you need to run the following as a regular user:

mkdir -p $HOME/.kube
sudo cp -i /etc/kubernetes/admin.conf $HOME/.kube/config
sudo chown $(id -u):$(id -g) $HOME/.kube/config

Alternatively, if you are the root user, you can run:

export KUBECONFIG=/etc/kubernetes/admin.conf

You should now deploy a pod network to the cluster.
Run "kubectl apply -f [podnetwork].yaml" with one of the options listed at:
 https://kubernetes.io/docs/concepts/cluster-administration/addons/

Then you can join any number of worker nodes by running the following on each as root:

kubeadm join 172.31.90.144:6443 --token 75sp2s.4moocvobfpkimn9q \
 --discovery-token-ca-cert-hash sha256:42855a37f6c6446da3abb79740e05317a4aadc79d228cf7df4339bd90fd6f19d
ubuntu@ip-172-31-90-144:~$ |
```

**Step 6:** Copy the mkdir and chown commands from the top and execute them.

mkdir -p \$HOME/.kube

sudo cp -i /etc/kubernetes/admin.conf \$HOME/.kube/config sudo chown \$(id -u):\$(id -g) \$HOME/.kube/config

```
ubuntu@ip-172-31-90-144:~$ mkdir -p $HOME/.kube sudo cp -i /etc/kubernetes/admin.conf $HOME/.kube/config sudo chown $(id -u):$(id -g) $HOME/.kube/config ubuntu@ip-172-31-90-144:~$
```

**Step 7:**Add a common networking plugin called **flannel** as mentioned in the code. Flannel is a simple and widely used networking plugin for Kubernetes that facilitates pod-to-pod communication across a cluster.

kubectl apply -f

https://raw.githubusercontent.com/coreos/flannel/master/Documentation/kube-flannel.yml

```
ubuntu@ip-172-31-90-144:~$ kubectl apply -f https://raw.githubusercontent.com/coreos/flannel/master/Documentation/kube-flannel.yml namespace/kube-flannel created clusterrole.rbac.authorization.k8s.io/flannel created clusterrolebinding.rbac.authorization.k8s.io/flannel created serviceaccount/flannel created configmap/kube-flannel-cfg created daemonset.apps/kube-flannel-ds created ubuntu@ip-172-31-90-144:~$
```

**Step 8**: With the cluster now running, we can deploy our **Nginx server** onto it. Run the following command to apply the deployment configuration and set up the Nginx deployment.

kubectl apply -f https://k8s.io/examples/application/deployment.vaml

```
ubuntu@ip-172-31-90-144:~$ kubectl apply -f https://k8s.io/examples/application/deployment.yaml deployment.apps/nginx-deployment created ubuntu@ip-172-31-90-144:~$ |
```

## kubectl get pods

```
ubuntu@ip-172-31-90-144:~$ kubectl get pods
NAME
                                    READY
                                             STATUS
                                                       RESTARTS
                                                                   AGE
nginx-deployment-d556bf558-6r7bm
                                    0/1
                                             Pending
                                                       0
                                                                   76s
nginx-deployment-d556bf558-bv4vz
                                    0/1
                                             Pending
                                                       0
                                                                   76s
ubuntu@ip-172-31-90-144:~$
```

```
ubuntu@ip-172-31-90-144:~$ POD_NAME=$(kubectl get pods -l app=nginx -o jsonpath="{.items[0].metadata.name}")
ubuntu@ip-172-31-90-144:~$ |
```

POD\_NAME=\$(kubectl get pods -l app=nginx -o jsonpath="{.items[0].metadata.name}") kubectl port-forward \$POD\_NAME 8080:80

```
ubuntu@ip-172-31-90-144:~$ POD_NAME=$(kubectl get pods -l app=nginx -o jsonpath="{.items[0].metadata.name}")
ubuntu@ip-172-31-90-144:~$ |

ubuntu@ip-172-31-90-144:~$ kubectl port-forward $POD_NAME 8080:80
error: unable to forward port because pod is not running. Current status=Pending
ubuntu@ip-172-31-90-144:~$ |
```

**Note**: If you encounter an error where the pod status shows as "**Pending**," follow these steps. Run the commands below to resolve the issue, and then re-run the previous two commands.

kubectl taint nodes --all node-role.kubernetes.io/control-plane-node/ip-172-31-20-171 untainted

```
ubuntu@ip-172-31-90-144:~$ kubectl taint nodes --all node-role.kubernetes.io/control-plane-node/ip-172-31-90-144 untainted ubuntu@ip-172-31-90-144:~$ |
```

#### kubectl get nodes

```
ubuntu@ip-172-31-90-144:~$ kubectl get nodes

nginx-deployment-d556bf558-bv4vz
                                    1/1
                                            Running
                                                       0
                                                                  27m
ubuntu@ip-172-31-90-144:~$
```

POD\_NAME=\$(kubectl get pods -l app=nginx -o jsonpath="{.items[0].metadata.name}") kubectl port-forward \$POD\_NAME 8080:80

```
ubuntu@ip-172-31-90-144:~$ POD_NAME=$(kubectl get pods -l app=nginx -o jsonpath="{.items[0].metadata.name}")
ubuntu@ip-172-31-90-144:~$ |

ubuntu@ip-172-31-90-144:~$ POD_NAME=$(kubectl get pods -l app=nginx -o jsonpath="{.items[0].metadata.name}")
kubectl port-forward $POD_NAME 8080:80
Forwarding from 127.0.0.1:8080 -> 80
Forwarding from [::1]:8080 -> 80
```

**Step 9 :** Check if your deployment is working. Open a new terminal and connect to your EC2 instance using SSH. Then, run the curl command to see if the Nginx server is up and running.

#### curl --head http://127.0.0.1:8080

```
ubuntu@ip-172-31-90-144:~$ curl --head http://127.0.0.1:8080
HTTP/1.1 200 OK
Server: nginx/1.14.2
Date: Sat, 28 Sep 2024 05:44:34 GMT
Content-Type: text/html
Content-Length: 612
Last-Modified: Tue, 04 Dec 2018 14:44:49 GMT
Connection: keep-alive
ETag: "5c0692e1-264"
Accept-Ranges: bytes
ubuntu@ip-172-31-90-144:~$
```

## After handling connecton

```
ubuntu@ip-172-31-90-144:~$ POD_NAME=$(kubectl get pods -l app=nginx -o jsonpath="{.items[0].metadata.name}") kubectl port-forward $POD_NAME 8080:80 Forwarding from 127.0.0.1:8080 -> 80 Forwarding from [::1]:8080 -> 80

Handling connection for 8080
```

If you get a **200 OK** response and see the Nginx server name, your deployment was successful.

#### **CONCLUSION:**

In this experiment, we successfully installed Kubernetes on an EC2 instance and deployed an Nginx server using various Kubectl commands. During the process, we faced two main problems. The first issue was that the Kubernetes pod was stuck in a pending state. We fixed this by removing the control-plane taint with the command **kubectl taint nodes --all**, which allowed the pod to schedule correctly. The second problem was a missing containerd runtime, which we resolved by installing and starting the containerd service. To make sure our Kubernetes setup had enough resources, we used a t2.medium EC2 instance with 2 virtual CPUs. Overall, these steps led to a successful deployment of the Nginx server, showing how effective Kubernetes can be in a cloud environment.
